LIMITED WARRANTY

All SD Systems products assembled by SD personnel and functionally tested at our facility are warranted for a period of ninety (90) days from date of purchase to be free from defects of material and workmanship. Kits or other products functionally unfinished or semi-finished at the time of shipment from our facility are warranted for the same period in regard to material defects only, with no warranty, expressed or implied, covering workmanship of others. Should an SD Systems product fail to perform to specifications, obtain a Returned Material Authorization number from your dealer or from SD Systems. Include this number in all correspondence and with the returned product. Ship the item prepaid to SD Systems and it will, at our option, be repaired or replaced free of charge, provided the unit is received during the warranty period. Testing or repair work performed upon returned kits or other products assembled wholly or partially by others will be subject to a \$35.00 minimum service charge unless such products are found to be non-functional due to defects in material purchased from SD Systems.

In order to validate this warranty, the enclosed warranty card must be returned to SD Systems. If no warranty card is on file at the time of product return, dated proof of purchase will be required.

This warranty is invalid if product has been misused or modified. Warranty is limited to replacement of defective parts and no responsibility is assumed for damage to other equipment.

THERE ARE NO UNDERSTANDINGS, AGREEMENTS, REPRESENTATIONS, OR WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING ANY REGARDING FITNESS FOR A PARTICULAR PURPOSE, NOT SPECIFIED IN THE WARRANTY.

SECTION I

1-0 INTRODUCTION

The EXPANDORAM II board provides a low cost means for expanding Random Access Memory capability for computers utilizing the S-100 bus structure.

The EXPANDORAM II is optimized for operation with SD Systems' SBC-100/200. The EXPANDORAM II uses the Z-80 refresh signal and will operate at 4 MHZ if sufficiently fast rams are used.

1-1 GENERAL DESCRIPTION

The EXPANDORAM II board is a high performance dynamic RAM board using state-of-the-art MOS dynamic memory devices. The EXPANDORAM II may be configured to have a memory capacity of 16K, 32K, 48K, or 64K bytes of memory using the MK 4116 (16,384X1 MOS dynamic RAM) or 64K, 128K, 192K, or 256K bytes of memory using the MK4164 (65,536X1 MOS dynamic RAM) memories. Other notable features of the EXPANDORAM II board include:

- (1) Phantom output disable or manual switch selectable output disable.
- (2) Typical power dissipation of 5 watts
- (3) 4 MHZ operation
- (4) Port Addressable board select for multi-user system
- (5) With 4164's, 4-64K banks are available

1-2 PHYSICAL

The EXPANDORAM II board is implemented on a single 5.25" x 10.0" x 0.65" Printed Circuit board. The board requires three DC voltages at levels of +7V to +10V, +14V to +18V, and -14V to -18V. The EXPANDORAM II board is interfaced to the system by connector J-1. Table 1-1 lists the overall specifications for the EXPANDORAM II board.

TABLE 1-1
SPECIFICATIONS

Memory Capacity	Up to 65,536 bytes (16K RAM) Up to 262,144 bytes (64K RAM)
Memory Access	200 ns max.
Memory Cycle	375 ns min.
Interface Levels	TTL Compatible
Power (2 us memory cycle)	+7V to +10V @ 400mA (max) +14V to +2-V @ 200mA (max) -14V to -20V @ 30mA (max)
Physical Dimensions	5.25" x 10.0" x .65"
Operating Temperature	0 degree C to 50 degree C

SECTION 2

2-0 FUNCTIONAL DESCRIPTION

The major functions of the EXPANDORAM II board are shown in figure 2-1. The following functions make up the memory interface: memory array, memory decode and control, address multiplexer, and data buffer.

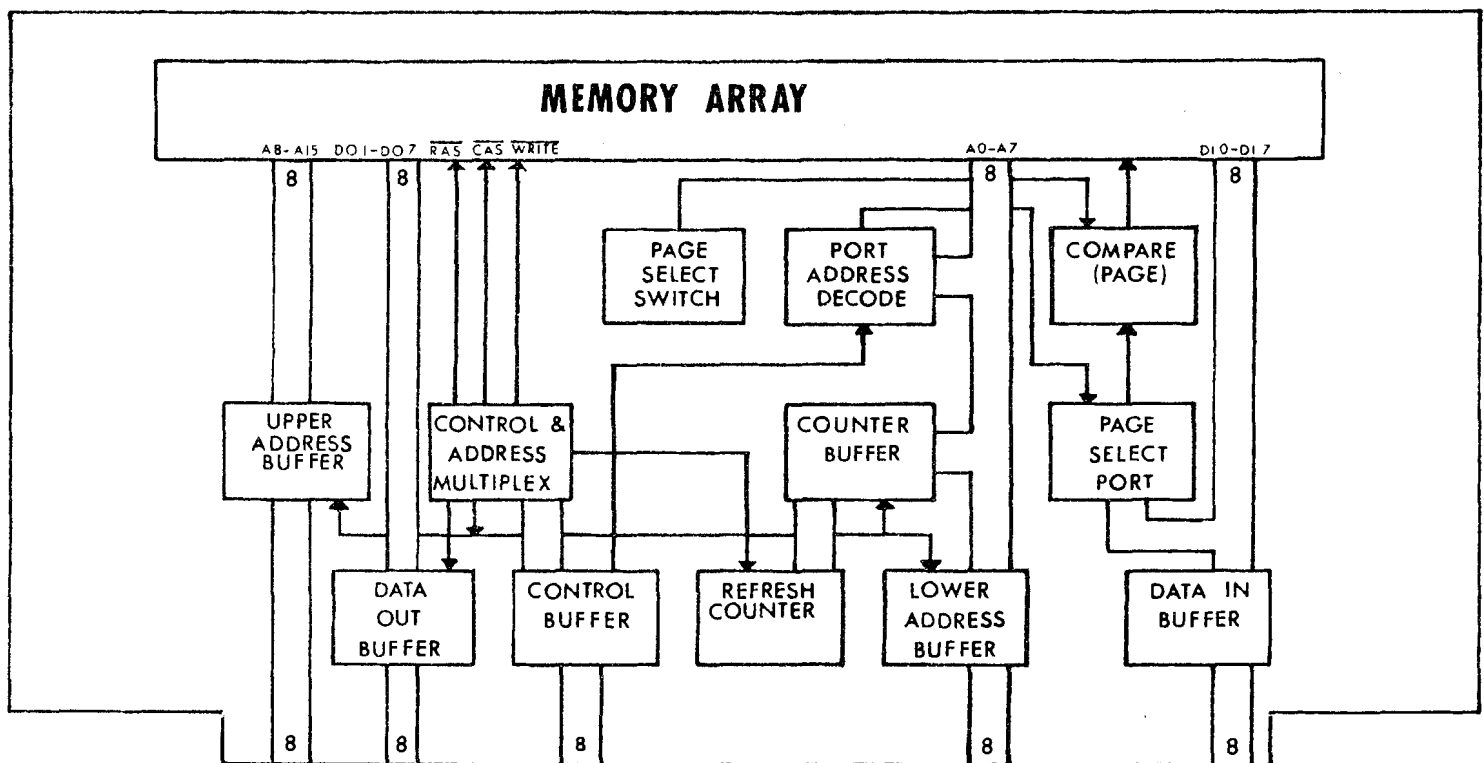

Memory Array - The memory array consists of up to 32 (16K or 64K) dynamic random access memory elements. Each 16K has a 16,384 x 1 bit capacity, while the 64K has a 65,536 x 1 bit capacity. The 32 (16K or 64K) RAMS are organized into four banks of eight RAMS each. The eight RAMS each contribute one bit to an addressable location. The total storage capacity of the EXPANDORAM II is 64,536 or 262,144 bytes, depending on the type of memory device used (16K or 64K).

Memory Decode and Control - The memory decode and control section is responsible for generating the timing signals for the memory array, address multiplexer, and data buffer. Timing within the memory decode and control section is generated by a TTL compatible delay line. An 82S130 PROM is used to select the proper banks according to the address lines, board select switches, and the board select latch. (See Section 4 for more details on Proms).

Address Multiplexer - The address multiplexer is responsible for taking the address bits from the address bus buffers and multiplexing the proper row and column address into the memory array under control of the memory decode and control section.

Data Buffers - The data buffers, controlled by the memory decode and control section, isolate the memory array from the data bus.

Port FF Board Select - The port FF board select decodes port FF and latches the output data on the board.

EXPANDORAM II BLOCK DIAGRAM

Figure 2-1

SECTION 3

3-0 CONSTRUCTION

The EXPANDORAM II board kit is intended for those persons who have had some prior experience with kit building and digital electronics. If you do not fall into this category, it is highly recommended that you find an experienced person to help you assemble and check out the board.

Appendix E shows the parts list for the EXPANDORAM II board. Double check all parts against the parts list.

3-1 ASSEMBLY PROCEDURE

- (1) Install and solder the IC sockets in their proper locations as follows:

- () 14-Pin - U1,U3-U7,U9,U10,U12,U17-U19,U21,U22,U58
- () 16-Pin - U8,U11,U13,U15,U16,U26-U57
- () 20-Pin - U14,U20,U23-U25

NOTE: No sockets for U2 or DIP switch S3.

- (2) Install and solder the resistors as follows:

- () R1, R4 33 Ohm (Orange, Orange, Black)
- () R2, R6, R8 1K Ohm (Brown, Black, Red)
- () R3 3.3K Ohm (Orange, Orange, Red)
- () R5 150 Ohm (Brown, Green, Brown)
- () R7 10K Ohm (Brown, Black, Orange)
- () R9 470 Ohm (Yellow, Violet, Brown)
- () R10 200 Ohm (Red, Black, Brown)
- () Resistor packs: RP1 3, 4, 5 10 Pin SIP - 3.3K
RP2 6 Pin SIP - 3.3K

NOTE: Pin 1 of each SIP is designated by a notch or a dot on one end of the package.

- (3) Install and solder diodes CR1, and CR2 with the banded end as shown on the PC board.
- () CR1 1N751
 - () CR2 1N914 or 1N4148
- (4) Install and solder the capacitors as follows:
- () C1,C5,C8,C12,C14,C16 10MF Tantalum (Note Polarity)
 - () C2,C4,C6,C7,C9,C10,C13,C17-64 .1MF MICA
 - () C15,C3 200PF MICA
- (5) Install and solder the two voltage regulators with the heatsink, using the 6-32 hardware supplies. NOTE: There are two types of voltage regulators, a +5V and a +12V. Be sure that the regulators are installed as shown on the Assembly Drawing.
- () VR1 +5V 7805 or LM 340T-5
 - () VR2 +12V 7812 or LM 340T-12
- (6) Install two PCB ejectors using pins (See Assembly Drawing).
- (7) Install and solder DIP switch.
- () S3 Observe the proper position of the PC board (the ON side should be toward the top of the board).
- (8) Install and solder the delay line (U2) observing the location of pin 1
- () U2 (DDU-4-5250 or PE21214 or TTLDL250)
- (9) Double check all solder connections for cold solder joints, unsoldered connections, or shorted connections.

3-2 CHECK OUT PROCEDURE

- (1) Install the board in the computer and measure the output of the

+5V and +12V regulators, VR1 and Vr2,

() VR1 = 5 volts

() VR2 = 12 volts

(2) Measure the power supply voltages in the memory array. (Any of the memory array IC sockets can be used.)

() Pin 1 U29 = -5V

() Pin 8 U29 = +12V

() Pin 9 U29 = +5V

NOTE: DO NOT PROCEED WITH BOARD CHECK-OUT UNTIL ALL POWER SUPPLY VOLTAGES ARE CORRECT. The TTL logic and MOS memories can be permanently damaged if improper voltages are applied.

(3) Install the IC's in their sockets observing the Pin 1 designation on each socket on the PC board.

*() U26-33	(Bank 0)	RAM
*() U34-41	(Bank 1)	RAM
*() U42-49	(Bank 2)	RAM
*() U50-57	(Bank 3)	RAM

*NOTE: If less than 64K is being installed on the board then refer to Section IV under ADDRESSING SWITCH to determine in which Bank the memory should be installed.

(4) Double check all IC's for proper orientation and location.

(5) Refer to UTILIZATION SECTION for proper configuration of jumper options, and connect jumper options as required.

(6) Install board into computer and turn on power.

(7) By using front panel or monitor program, deposit data into a memory location that falls within the boundaries of the EXPANDORAM II board. Now examine the same location in which data was deposited. If the proper data is not read back, power the system down and double check the following:

(1) Check ADDRESSING DIP Switch and board Select Dip Switch for the correct settings.

(2) Check jumper options.

(8) Reinstall the board and once again try to write and read data from the EXPANDORAM II board by the use of a front panel or monitor program. If some of the data bits appear to be stuck, power down the board and examine the memory array for bent pins, or a defective

memory device. If the board does not respond in any way to write or read data, then examine the TTL IC's for bent pins or improper insertions into the socket.

(9) If the read/write test is successful, verify that memory on the EXPANDORAM II can be accessed in every bank of memory that is installed on the board.

(10) If all banks can be written to and read back properly, complete check-out of the board by loading the memory test that is shown in Appendix A. Execute the test and verify that all locations within the memory array are functional.

NOTE: When executing the memory diagnostic, it is recommended that the memory board not be on an extender card. Use of an extender card may introduce external noise into the board.

SECTION 4

4-0 UTILIZATION

This section will explain the various options for the EXPANDORAM II memory card.

4-1 16K or 64K DEVICE SELECTION JUMPERS

Two types of RAMS may be used with the EXPANDORAM II. These are the 16K RAM (4116) and the 64K (4164). The board comes in a standard configuration that uses 16K RAMS. In order to use the 64K RAMS the following cuts and connections must be made:

- A. Cut etch between E1 and E2 *CUT E16-E17*
- B. Cut etch between E4 and E5
- C. Cut etch between E6 and E8
- D. Connect E2 to E3 *CONNECT C17-E2*
- E. Connect E6 to E7

4-2 PROM INFORMATION

There are two proms available for use with the EXPANDORAM II. These proms perform memory decoding. These are for use with 32K or 48K partition multi-user systems. If the board is used in a single-user environment, either Prom will work. In addition, other Proms may be configured if the user desires.

4-3 SWITCH SETTINGS

The information for the switch settings of S3 for the EXPANDORAM II is given in figure 4-1.

Port FF is used to select the Memory page (32K or 48K) to be accessed by the CPU. Up to 10 pages (0-9) may be in a system simultaneously, by using either 6 Expandoram II boards with a 32K Prom or 8 Expandoram II board with a 48K Prom (user 0AH has 16K positioned at 0 C000H). The pages are accessed by outputting the page number to port FF. See Figure 4-2 for page mapping and Prom program information.

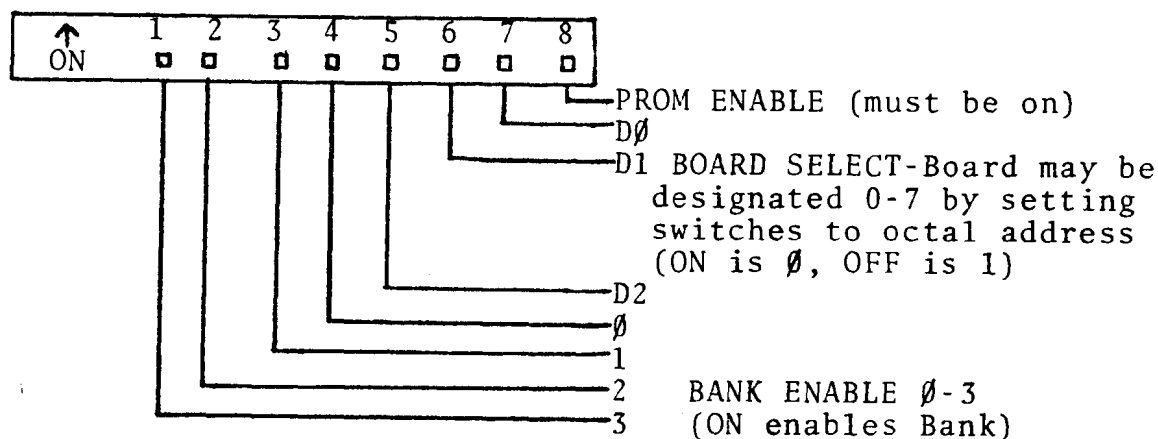

FIGURE 4-1

4-4 USING THE EXPANDORAM II IN NON-SD SYSTEMS ENVIRONMENTS

Some CPU boards supply a different phase of the system clock on pins 24 and 25. If one of these CPU boards are used with the Expandoram II, make the following change. Cut the etch on the back of the board between E22 and E23. Install a jumper between E23 and E24. Also cut the etch between E26 and E25 and install a jumper between E26 and E27. Install the phantom disable jumper between E9 and E10 if the system has other memory in conflict with the Expandoram II board. In addition, if the system is operated at

at 4 MHZ, install the jumper between E14 and E15 to enable M1
Wait States.
